#### **DESCRIPTION**

PT6961 is an LED Controller driven on a 1/5 to 1/8 duty factor. 11 segment output lines, 6 grid output lines, 1 segment/grid output lines, one display memory, control circuit, key scan circuit are all incorporated into a single chip to build a highly reliable peripheral device for a single chip microcomputer. Serial data is fed to PT6961 via a four-line serial interface. Housed in a 32-pin SOP, PT6961 pin assignments and application circuit are optimized for easy PCB Layout and cost saving advantages.

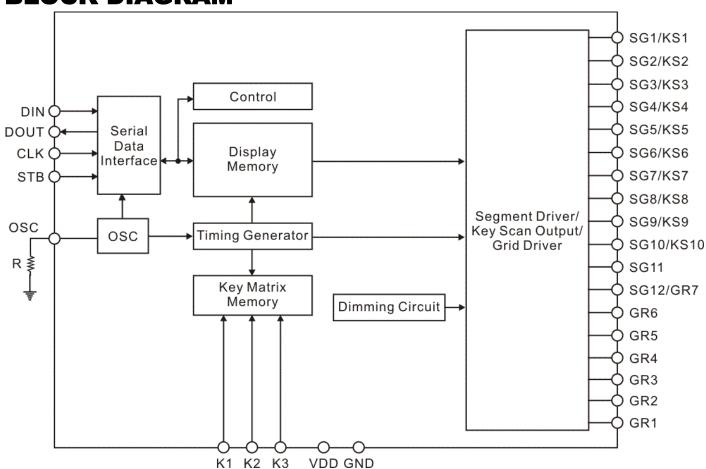

## **APPLICATIONS**

- Micro-computer Peripheral Device
- VCR set
- Combo set

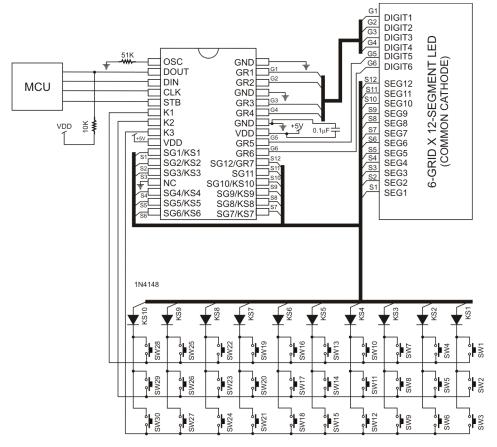

#### **FEATURES**

- CMOS technology
- Low power consumption
- Multiple display modes (12 segments, 6 grids to 11 segments, 7 grids)
- Key scanning (10 x 3 Matrix)
- 8-Step dimming circuitry
- Serial interface for Clock, Data Input, Data Output, Strobe Pins
- Available in 32-pin, SOP

## **BLOCK DIAGRAM**

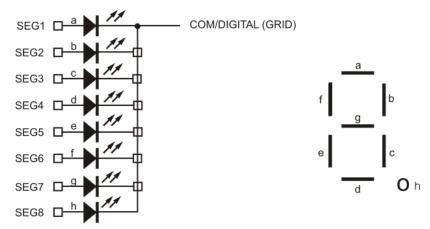

# **APPLICATION CIRCUIT**

#### Notes:

- 1. The capacitor (0.1µF) connected between the GND and the VDD pins must be located as close as possible to the PT6961 chip.
- 2. It is strongly suggested that the NC pin (pins 13) be connected to the GND.
- 3. The PT6961 power supply is separate from the application system power supply.

## COMMON CATHODE TYPE LED PANEL

# **ORDER INFORMATION**

V1.5 3 January 2010

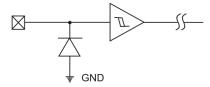

# **PIN DESCRIPTION**

Pin Name	I/O	Description	Pin No.
OSC	I	Oscillator Input Pin A resistor is connected to this pin to determine the oscillation frequency	1
DOUT	0	Data Output Pin (N-Channel, Open-Drain) This pin outputs serial data at the falling edge of the shift clock.	2
DIN	I	Data Input Pin This pin inputs serial data at the rising edge of the shift clock (starting from the lower bit)	3
CLK	ı	Clock Input Pin This pin reads serial data at the rising edge and outputs data at the falling edge.	4
STB	I	Serial Interface Strobe Pin The data input after the STB has fallen is processed as a command. When this pin is "HIGH", CLK is ignored.	5
K1 ~ K3	I	Key Data Input Pins The data sent to these pins are latched at the end of the display cycle. (Internal Pull-Low Resistor)	6, 7, 8
VDD	-	Power Supply	9, 25
SG1/KS1 ~ SG10/KS10	0	Segment Output Pins (p-channel, open drain) Also acts as the Key Source	10 ~ 12 14 ~ 20
NC	-	No Connection	13
SG11	0	Segment Output pins (P-Channel, open drain)	
SG12/GR7	0	Segment / Grid Output Pins	
GR6 ~ GR1	0	Grid Output Pins	
GND	-	Ground Pin	26, 29, 32

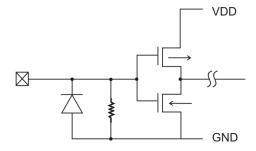

## INPUT/OUTPUT CONFIGURATIONS

The schematic diagrams of the input and output circuits of the logic section are shown below.

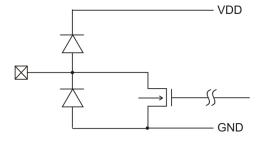

**INPUT PINS: CLK, STB & DIN** 

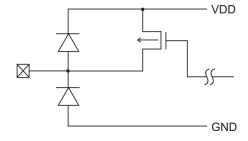

**OUTPUT PINS: K1 TO K3** 

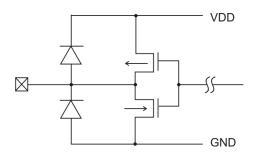

**OUTPUT PINS: DOUT, GR1 TO GR4** 

**OUTPUT PINS: SG1 TO SG11** 

**OUTPUT PINS: GR5, GR6 AND SG12/GR7** 

## **FUNCTION DESCRIPTION**

#### **COMMANDS**

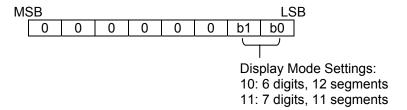

A command is the first byte (b0 to b7) inputted to PT6961 via the DIN Pin after STB Pin has changed from HIGH to LOW State. If for some reason the STB Pin is set to HIGH while data or commands are being transmitted, the serial communication is initialized, and the data/commands being transmitted are considered invalid.

#### COMMANDS 1: DISPLAY MODE SETTING COMMANDS

PT6961 provides 4 display mode settings as shown in the diagram below: As stated earlier a command is the first one byte (b0 to b7) transmitted to PT6961 via the DIN Pin when STB is LOW. However, for these commands, the bit 3 & bit 8 (b2 to b7) are given a value of 0.

The Display Mode Setting Commands determine the number of segments and grids to be used (12 to 11 segments, 6 to 7 grids). A display command ON must be executed in order to resume display. If the same mode setting is selected, no command execution is take place, therefore, nothing happens.

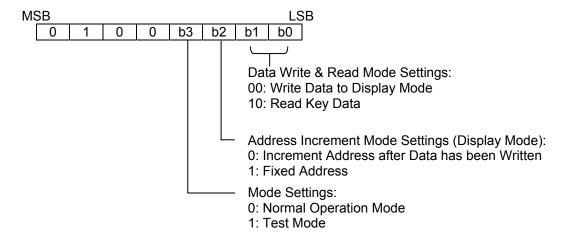

When Power is turned ON, the 7-grid, 11-segment modes is selected.

#### **COMMANDS 2: DATA SETTING COMMANDS**

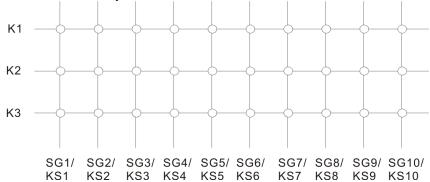

The Data Setting Commands executes the Data Write or Data Read Modes for PT6961. The data Setting Command, the bits 5 and 6 (b4, b5) are given the value of 0, bit 7 (b6) is given the value of 1 while bit 8 (b7) is given the value of 0. Please refer to the diagram below.

When power is turned ON, bit 4 to bit 1 (b3 to b0) are given the value of 0.

#### PT6961 KEY MATRIX & KEY INPUT DATA STORAGE RAM

PT6961 Key Matrix consists of 10 x 3 array as shown below:

Each data entered by each key is stored as follows and read by a READ Command, starting from the last significant bit. When the most significant bit of the data (b7) has been read, the least significant bit of the next data (b0) is read.

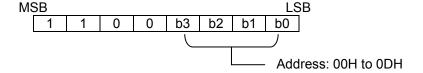

K1K3	K1K3		1	
SG1/KS1	SG2/KS2	x		
SG3/KS3	SG4/KS4	x		Dooding
SG5/KS5	SG6/KS6	x		Reading Sequence
SG7/KS7	SG8/KS8	x		Sequence
SG9/KS9	SG10/KS10	X	'	
b0b2	b3b5	b6b7		

Note: b6 and b7 do not care.

#### **COMMANDS 3: ADDRESS SETTING COMMANDS**

Address Setting Commands are used to set the address of the display memory. The address is considered valid if it has a value of 00H to 0DH. If the address is set to 0EH or higher, the data is ignored until a valid address is set. When power is turned ON, the address is set at 00H.

Please refer to the diagram below.

#### DISPLAY MODE AND RAM ADDRESS

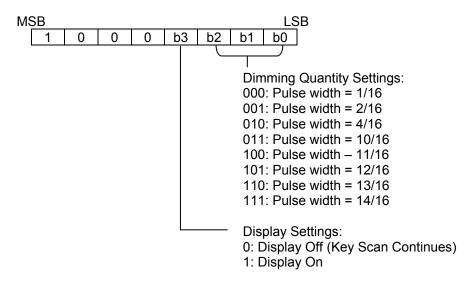

Data transmitted from an external device to PT6961 via the serial interface are stored in the Display RAM and are assigned addresses. The RAM addresses of PT6961 are given below in 8 bits unit.

SG1	SG4	SG5	SG8	SG9		SG12	SG13		SG14	
	00HL	00HU			01HL		C	)1HU		DIG1
	02HL	02HU			D3HL		C	3HU		DIG2
	04HL	04HU			05HL		C	5HU		DIG3
	06HL	06HU			07HL		C	7HU		DIG4
	08HL	UH80			D9HL		C	9HU		DIG5
	0AHL	0AHU		(	BHL		0	BHU		DIG6
	0CHL	0CHU	•	(	DHL		0	DHU		DIG7

b0	b3	b4		b7
xxHL			xxHU	
Lower 4 bits		Higher 4 bits		

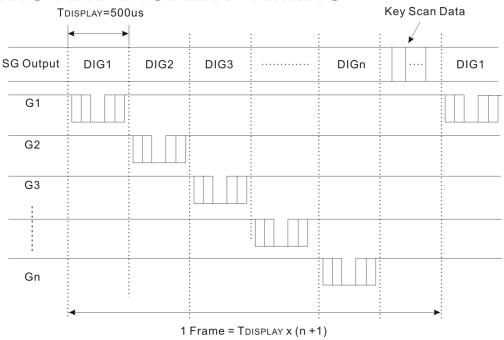

#### **COMMAND 4: DISPLAY CONTROL COMMANDS**

The Display Control Commands are used to turn ON or OFF a display. It also used to set the pulse width. Please refer to the diagram below. When the power is turned ON, a 1/16 pulse width is selected and the displayed is turned OFF (the key scanning is started).

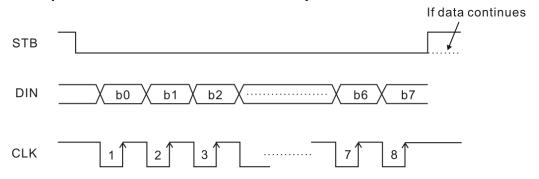

# **SCANNING AND DISPLAY TIMING**

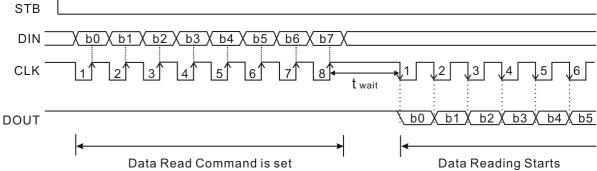

## **SERIAL COMMUNICATION FORMAT**

The following diagram shows the PT6961 serial communication format. The DOUT Pin is an N-channel, open-drain output pin; therefore, it is highly recommended that an external pull-up resistor (1 K $\Omega$  to 10 K $\Omega$ ) must be connected to DOUT.

## RECEPTION (DATA/COMMAND WRITE)

## TRANSMISSION (DATA READ)

where: twait (waiting time) ≥ 1µs

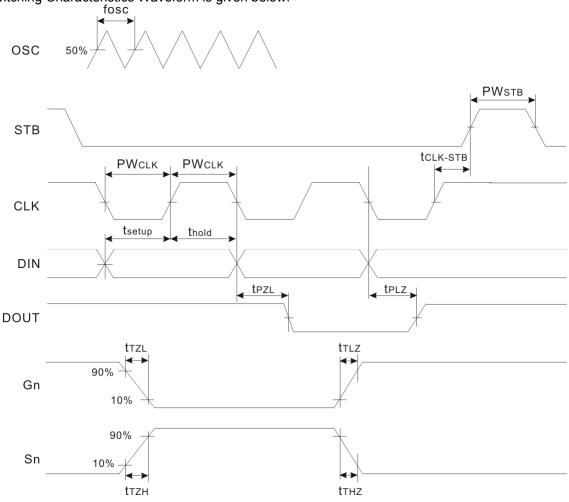

It must be noted that when the data is read, the waiting time (twait) between the rising of the eighth clock that has set the command and the falling of the first clock that has read the data is greater or equal to  $1\mu s$ .

V1.5 10 January 2010

## SWITCHING CHARACTERISTIC WAVEFORM

PT6961 Switching Characteristics Waveform is given below.

where:

PW<sub>CLK</sub> (Clock Pulse Width)  $\geq$  400ns  $t_{setup}$  (Data Setup Time)  $\geq$ 100ns  $t_{CLK-STB}$  (Clock - Strobe Time)  $\geq$  1 $\mu$ s fosc = Oscillation Frequency  $t_{TZL} \leq 1\mu$ s

 $PW_{STB}$  (Strobe Pulse Width)  $\geq 1\mu s$  $t_{hold}$  (Data Hold Time)  $\geq 100 ns$ 

 $t_{THZ}$  (Fall Time)  $\leq 10 \mu s$ 

 $t_{PZL}$  (Propagation Delay Time)  $\leq$  100ns  $t_{PLZ}$  (Propagation Delay Time)  $\leq$  300ns

 $t_{TLZ} \le 10 \ \mu s$ 

Note:

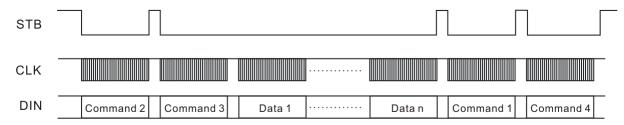

Test Condition Under

 $t_{THZ}$  (Pull low resistor) = 10K $\Omega$ , Loading capacitor = 300pF  $t_{TLZ}$  (Pull high resistor) = 10K $\Omega$ , Loading capacitor = 300pF

## **APPLICATIONS**

Display memory is updated by incrementing addresses. Please refer to the following diagram.

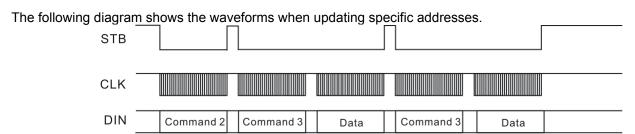

where:

Command 1: Display mode setting command

Command 2: Data setting command Command 3: Address setting command

Data 1 to n: Transfer display data (14 bytes max.)

Command 4: Display control command

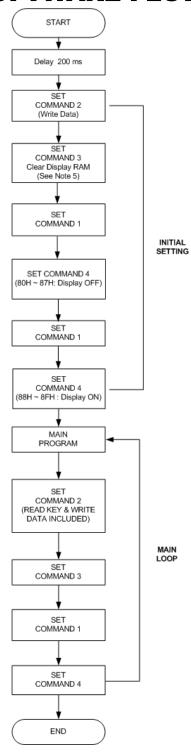

where:

Command 2: Data setting command Command 3: Address setting command

Data: Display data

## RECOMMENDED SOFTWARE FLOWCHART

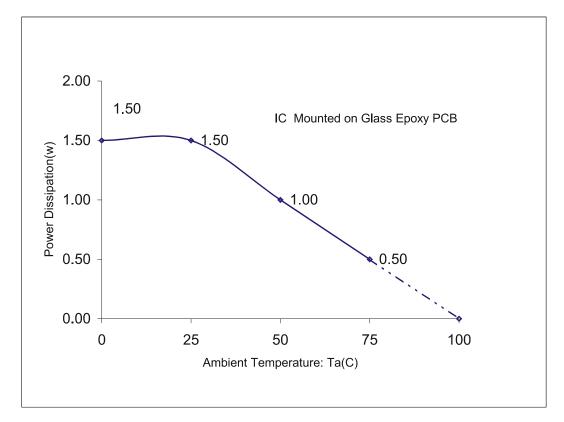

#### Notes:

- Command 1: Display Mode Commands
- 2. Command 2: Data Setting Commands
- 3. Command 3: Address Setting Commands
- 4. Command 4: Display Control Commands
- When IC power is applied for the first time, the contents of the Display RAM are not defined; thus, it is strongly suggested that the contents of the Display RAM be cleared during the initial setting.
